erdealer

End-to-End Process Flow & API Reference

Step-by-step walkthrough of the full loan lifecycle — from dealer onboarding through customer origination, field investigation, sanction, e-Mandate/e-Sign, vehicle delivery, final review, and disbursement — with the exact API called at every step.

13 steps · 4 roles (Dealer · HO · FI · System)

STEP 1

Dealer Onboarding (Self-Registration)

ACTOR: New Dealer

A prospective dealer registers themselves — firm details, owner KYC (Aadhaar/PAN), GST, bank details, and required documents (Trade Certificate, GST Registration, Firm PAN, Latest OEM Invoice, Owner Aadhaar/PAN, Letter of Intent, Cancelled Cheque, GSTR-9, Showroom/Service Centre photos, Live Selfie).

Along the way, several third-party verifications run inline: GSTIN verify, Firm PAN verify, Owner Aadhaar eKYC, Owner PAN verify, mobile OTP, and bank penny-drop (confirms the account holder name on the cancelled cheque).

Component: `DealerOnboardingForm.jsx`

API used

POST `{BASE_URL}/dealers` — `DEALER_ONBOARDING`
Multipart form: firm/owner details + all uploaded documents + third-party verification responses stored alongside (GSTIN, PAN, Aadhaar, penny-drop).

Result: a dealer record is created with `status: "PENDING"`, awaiting HO review.

STEP 2

Dealer Verification & Approval by HO

ACTOR: Head Office (HO)

HO opens the dealer's full application — firm KYC, GSTIN taxpayer details (filing history, business address, goods/services declared), owner PAN/Aadhaar, and every uploaded document — and decides to approve or reject.

Component: `DealerDetails.jsx` (route: `/dealer-details/:dealerId`)

API used

POST `{BASE_URL}/dealers/{dealer.id}/status`
Body: `{ status: "ACTIVE" }` (approve) or `{ status: "REJECTED" }` (reject)

Result: on approval, the dealer's `status` becomes `ACTIVE` — they can now log in and start sourcing customer leads.

STEP 3

Dealer Login with OTP

ACTOR: Dealer

The approved dealer logs in with username/password + captcha, then verifies a mobile OTP before reaching their dashboard. The OTP-verify response returns the dealer's full profile (including their real ID), which is merged into the session and used by every subsequent page.

Components: `Login.jsx` → `OtpVerify.jsx`

APIs used

POST `{BASE_URL}/login` — `API.LOGIN` — `{ user_id, password }`

POST `{BASE_URL}/send-otp` — `API.SEND_OTP` — `{ mobile }`

POST `{BASE_URL}/verify-mobile-otp` — `API.OTP_VERIFY` — multipart `{ mobile, otp, dealer_id }`

Result: session stored in `localStorage` (`user` , `token` , `dealer_id` , `dealer_status`) → redirected to `/dealer-dashboard` .

STEP 4 · CUSTOMER ONBOARDING — STAGE 1

Applicant Verification

ACTOR: Dealer (on behalf of Customer)

Dealer starts a new lead and captures full KYC for both the **Applicant** and **Co-Applicant**: mobile OTP, Aadhaar eKYC, PAN verify, and a Credit Bureau (CB) pull for each. Gender/marital status are also captured here — they determine which relations are valid for the co-applicant (e.g. unmarried applicants can only add "Father"; an unmarried female applicant is not eligible for this loan at all).

Component: `ApplicantVerification.jsx` (route: `/applicant-verification`, Dealer-only)

APIs used (third-party KYC/CB provider)

POST `{BASE_URL_CUSTOMER}/auth/stage` — `checkStage` — sends OTP + resumes any in-progress application
POST `{BASE_URL_CUSTOMER}/auth/otp/verify` — `verifyOtp`
POST `{BASE_URL_CUSTOMER}/kyc/ekyc/initiate` / `co-applicant/initiate` — Aadhaar eKYC link generation
POST `{BASE_URL_CUSTOMER}/kyc/pan/verify` / `co-applicant/verify` — PAN verification
POST `https://uat.teamvedika.com/processWebCbHits` + `checkCbStatusForSweb` — CB (CIBIL) pull for applicant & co-applicant

Save API

POST `{BASE_URL}/application/create` — `CUSTOMERSTAGE_FIRST`
Body: applicant + co-applicant KYC fields, gender/marital status, co-applicant relation, CB scores, dealer_id, raw third-party responses.

⚠ `applicant_gender`, `applicant_marital_status`, `co_applicant_relation`, `co_applicant_gender`, `co_applicant_marital_status` are sent to the backend but the column names were never explicitly confirmed via curl.

STEP 5 · CUSTOMER ONBOARDING — STAGE 2

Document Collection

ACTOR: Dealer (on behalf of Customer)

Dealer uploads KYC documents (Aadhaar, PAN, house proof), captures live selfies for applicant & co-applicant, enters bank details and runs a penny-drop verification (the returned account-holder name is matched against the applicant/co-applicant name), fills reference details (with a relation dropdown), uploads the vehicle quotation PDF, and picks occupation.

Component: `DocumentCollection.jsx` (route: `/document-collection`, Dealer-only)

APIs used

POST `https://vfpl.teamvedika.com/dealer-api/public/api/bank-account/verify` — `BANK_PENNY_DROP_API`
Body: `{ account_number, ifsc }` → returns `beneficiary_name_with_bank`, matched against applicant/co-applicant name before penny-drop is marked complete.

POST `{BASE_URL}/application/stage2` — `CUSTOMERSTAGE_SECOND`
Multipart: KYC documents, live images, bank details, references, quotation PDF, occupation, raw penny-drop response.

Validation rule: applicant, co-applicant, and both references must all have distinct mobile numbers — checked against values carried over from Stage 1.

STEP 6 · CUSTOMER ONBOARDING — STAGE 3

Offer Summary

ACTOR: Dealer (on behalf of Customer)

Dealer finalizes the loan structure: vehicle type/battery, ex-showroom & on-road price, loan amount, tenure — LTV and EMI are auto-calculated live (fixed 30% annual policy rate). Dealer subvention auto-fills from a loan-amount slab table (read-only). Customer accepts terms & conditions to complete onboarding.

Component: `OfferSummary.jsx` (route: `/offer-summary`, Dealer-only)

API used

POST `{BASE_URL}/application/stage3` — `CUSTOMERSTAGE_THIRD`
Body: vehicle/loan terms, monthly EMI, LTV ratio, dealer subvention, down payment figures, consent, employee_id, kyc_id.

```
LTV  = (loan_amount / on_road_price) × 100
EMI  = reducing-balance formula, principal = loan_amount, rate = 30%/12/100
Both must also match SanctionReview.jsx's later calculation (same formula duplicated there).
```

Result: customer onboarding is complete → lead now waits for FI (Field Investigation).

STEP 7

FI Verification with Video PD

ACTOR: FI Officer

FI officer fills in the Field Investigation form — residence address, accommodation type, house construction, family income/members, e-rickshaw usage plan — and runs a remote **Video Personal Discussion (Video PD)** session via the Think360 provider: a link is generated and shared to the applicant (WhatsApp/copy), who completes video KYC on their own device; FI officer then checks the session status until complete.

Component: `FI/CustomerDetails.jsx` (route: `/customer-details/:customerId`)

APIs used

POST `https://videopd.teamvedika.com/api/sweb/v1/verification/video-pd/initiate`
Body: `{ kyc_id, emp_id, applicationId, phoneNumber }` → returns `vpd_url` to share

POST `.../verification/video-pd/webhook` — polls session status until `session_status` reads "complete" (or a rejection code)

POST `{BASE_URL}/fi/save` — `FI_SAVE_API`
Body: full FI form (residence, income, e-rickshaw plan) + `vpd_session_id`, `pd_latitude` / `pd_longitude` (from the Video PD session's own location, not device GPS), `dist_from_dealer`, `distance_from_pd_to_customer_km`.

Result: `fi_status` becomes truthy → lead moves to HO for Sanction.

STEP 8

Sanction Review & Approval by HO

ACTOR: Head Office (HO)

HO reviews the complete applicant/co-applicant/vehicle/bank/reference file, the FI/GAR outcome (with full Video PD detail — selfie image, agent/user video, session feedback, all viewable/openable in a new tab), and can revise the loan amount, tenure, on-road price, and ex-showroom price before deciding — LTV/EMI recalculate live as these are edited. Decision: Approve / Decline / Refer back.

Component: `FI/SanctionReview.jsx` (route: `/sanction-review/:customerId`)

APIs used

GET `{BASE_URL}/er-loan/fi/{cust_id}` — `FI_DETAILS_GET_API`
Returns the full saved FI record — `request_payload` (everything from Step 7) + `response_payload` (the Video PD webhook result once the session completes: selfie/ video URLs, feedback, device info).

POST `{BASE_URL}/er-loan/save-sanction` — `SANCTION_SAVE_API`
Body: `{ cust_id, kyc_id, emp_id, decision, sanction_amt, sanction_note }`
`decision`: 1 = Approved, 2 = Declined, 3 = Referred back

POST `{BASE_URL}/er-loan/update-sanction-details` — `UPDATE_LOAN_STRUCTURE_API`
Body: `{ cust_id, kyc_id, sanction_amt, tenure, on_road_price, ex_showroom_price, ltv, emi, sanction_note }`

Result: `sanction_status = 1` → the same customer record now flows back to the Dealer for the post-sanction stage.

STEP 9 · POST-SANCTION BEGINS

Dealer Starts Post-Sanction: e-Mandate & e-Sign

ACTOR: Dealer

Once sanctioned, the same lead reappears for the dealer as **"Post Sanction Pending"** in their Sourcing Pipeline. Clicking the action button opens **Loan Execution FIRST** (not vehicle delivery) — the dealer initiates an e-NACH mandate (applicant authenticates via net-banking/debit card on a redirected page, then dealer confirms status), and sends an e-Sign request for the co-applicant's Aadhaar-OTP signature on the loan agreement.

Component: `LoanExecution.jsx` (route: `/loan-execution/:customerId`)

APIs used

POST `https://uat.teamvedika.com/api/er-loan/initiate-mandate` — `INITIATE_MANDATE_API` (x-www-form-urlencoded, `{ kyc_id, emp_id }`) → returns `mandate_page_url`

POST `{BASE_URL}/er-loan/check-mandate-status` — `CHECK_MANDATE_STATUS_API`
Body: `{ cust_id, kyc_id }` → confirms with NPCI whether mandate authentication is done

POST `https://uat.teamvedika.com/api/er-loan/initiate-esign` — `INITIATE_ESIGN_API` (x-www-form-urlencoded, `{ kyc_id, emp_id }`)

Result: once both are complete, the dealer is **automatically forwarded to Vehicle Delivery** — this is a client-side redirect, not a separate manual click.

STEP 10

Vehicle Details Entered by Dealer → Sent for HO Approval

ACTOR: Dealer

Dealer enters vehicle identification (vehicle/engine/chassis/battery numbers, battery make) and captures a live delivery photo (customer + vehicle), plus uploads supporting documents: Invoice, Insurance, RC Application, Quotation*, Disclaimer, RC Challan, Battery Photo, NO HPA Letter, Form 22.

Component: `VehicleDelivery.jsx` (route: `/vehicle-delivery/:customerId`)

API used

POST `{BASE_URL}/er-loan/save-vehicle-delivery` — `VEHICLE_DELIVERY_SAVE_API`
Multipart: `{ cust_id, kyc_id, emp_id, vehicle_no, engine_no, chassis_no, battery_no, battery_make }` + all document files.

⚠ Only 4 document field names are curl-confirmed: `delivery_photo`, `invoice`, `insurance`, `rc_application`. The other 6 (`quotation`, `disclaimer`, `rc_challan`, `battery_photo`, `no_hpa_letter`, `form_22`) are guessed field names — confirm with backend if uploads aren't persisting.

* Quotation auto-fills here from what was already uploaded in Step 5 — no re-upload needed unless replacing it.

Result: `vehicle_delevery_status = 1` → sent to HO for delivery verification.

STEP 11

HO Verifies Vehicle Details

ACTOR: Head Office (HO)

HO cross-checks the vehicle numbers against the sanctioned model and OEM invoice, reviews delivery evidence (photo, insurance, invoice, RC application) with a per-row confirm checklist, adds a verification remark, and picks an action: Release (to Mandate & e-Sign — no longer applicable post-reorder), Refer back, or Verify & release.

Component: `HODeliveryVerification.jsx` (route: `/ho-delivery-verification/:customerId`)

APIs used

GET `{BASE_URL}/er-loan/get-vehicle-delivery?cust_id=` — `VEHICLE_DELIVERY_GET_API` — fetches what the dealer submitted in Step 10

POST `{BASE_URL}/er-loan/save-ho-delivery-verification` — `HO_DELIVERY_VERIFICATION_SAVE_API`
Body: `{ cust_id, verified_by, remarks, action, vehicle_checks[], evidence_checks[] }`
`action`: `"release"` | `"referBack"` | `"verifyRelease"`

Result: `vehicle_delevery_status = 2` → funnel status becomes **"Mandate Approved"** (fully complete — mandate/eSign is guaranteed done by this point since it now gates vehicle delivery, per Step 9).

STEP 12

Final Review by HO

ACTOR: Head Office (HO)

A single consolidated, read-only page pulling together **everything** from every step above — Applicant/Co-Applicant (incl. CB Score, OD Amount, DPD, Total Balance), Reference, Bank (incl. penny-drop-verified Account Holder Name), Dealer, Vehicle, Vehicle Identification, full FI/Video PD detail (all ~37 fields + selfie/video links), Onboarding Documents, and Delivery Documents — organized as one master checklist so HO doesn't have to revisit every earlier page individually.

Component: `FI/FinalReview.jsx` (route: `/final-review/:customerId`)

APIs used (read-only aggregation)

GET `{baseURL}/public/api/customer/{customerId}` — the core customer record
GET `VEHICLE_DELIVERY_GET_API` — vehicle + delivery docs
GET `FI_DETAILS_GET_API` — full FI + Video PD detail

HO also has a **"Generate PDF"** ("Ready To Disbursement") action that snapshots the entire page via the browser's print-to-PDF — no backend call yet (see Step 13).

STEP 13 · FINAL

Auto Disbursement

ACTOR: Head Office (HO) / System

HO clicks "Ready To Disbursement" on the Final Review page after confirming every stage checks out.

⚠ **No confirmed backend endpoint exists for this step yet.** The button currently: (1) generates a print-to-PDF snapshot of the full customer file via the browser's native print dialog, and (2) marks the lead "Disbursed" locally in the UI only. A placeholder API key `AUTO_DISBURSEMENT_API` (`{BASE_URL}/er-loan/auto-disbursement`) exists in `apiRoutes.js`, following the same `er-loan/*` naming convention as every other confirmed endpoint, but it is **not called** — it needs a real URL/contract confirmed with the backend team before this step can actually trigger disbursement.

What's needed to complete this step

- Confirmed endpoint URL + HTTP method
- Request body fields (assumed: `cust_id`, `kyc_id`, `emp_id`)
- Response shape (success/failure, any disbursement reference/UTR number)
- Whether disbursement should also produce a real downloadable PDF (would need a library like `jspdf` / `puppeteer` — none installed currently)

— End of process flow —
